                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is that of human tumour necrosis factor related CC ligand (TRELL). TRELL or active fragments can be included with a CC carrier in pharmaceutical compositions to treat cancer, autoimmune CC diseases or immune responses to tissue grafts, or to stimulate or CC suppress the immune system. It is useful to screen for TRELL receptors by labelling with a detectable label and screening CC compositions for binding. Agents interfering with TRELL-receptor CC binding can also be screened for, can then be administered, Optionally with interferon gamma, to induce cell death or CC treat, suppress or alter immune responses (especially involving human CC adenocarcinoma cells) involving a signal pathway between TRELL and its receptor. It's coding sequence can be used in gene therapy for CC TRELL-related disorders in mammals (especially humans), e.g. tumours, CC autoimmune and inflammatory diseases or inherited genetic disorders.

The specification describes a method for preventing or treating an immunological disorder and/or inhibiting an immune response in an animal. The method comprises administering a TWEAK blocking agent. The method may be used for preventing and treating immune disorders associated with inappropriate expression and/or activity of TWEAK. These disorders include autoimmune diseases, acute and chronic inflammation, organ transplant rejection, Graft-versus-Host disease (GVHD), lymphoid cell malignancies, septic and other forms of shock, loss of immune responsiveness (as seen in human immunodeficiency virus (HIV) infections) and failure of the immune response to tumour growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure;

                                                                      The present sequence is that of human antitumour protein PRO207, as deduced from a foetal kidney cDNA clone (see AAA49717). PRC207 shows amino acid sequence identity to tumour necrosis factor family members, especially human lymphotoxin-beta (23.4%) and human CD40 ligand (19.8%). Mol.wt. is 27,216. A claimed method for inhibiting the growth of a tumour cell comprises exposing the tumor cell to PRO179, PRO207, PRO320, PRO219, PRO221, PRO224, PRO328, PRO301, PRO526, PRO362, PRO365, PRO509 or PRO866 (see AAY95337-49), their agonists or chimeric polypeptides incorporating them. The tumour is especially a cancer selected from breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder and central nervous system cancer, melanoma and leukaemia. Methods for the recombinant

                                                                                                                                                                                                                                                                                                                                                   Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to the isolation of novel human PRO polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, gilal, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polynucleotide sequences are also useful in gene therapy. AAU86128-AAU86162 represent the human PRO polypeptides of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC The TNF-related endothelium proliferative agent (TREPA), or its CC activators or agonists, are used to treat a deficit of TREPA, e.g. to CC promote wound healing or tissue grafting, by promoting vascularisation, CC also to induce apoptosis for treating cancer and eliminating autoreactive T cells, as an adjunct to cancer chemotherapy or antiviral treatment. CC TREPA peptides can also be used to target cytotoxic agents or for CC affinity isolation of the corresponding receptor, the nucleic acid for CC which can be used to transform tumour cells to render them more CC responsive to TREPA and to screen for TREPA mimics. CC RIDZYmes, antisense RNA, antibodies or peptides, are used to treat CC TREPA-associated diseases, e.g. tumours and metastases (by inhibiting CC conditions inclammation or a wide range of autoimmune conditions, CC conditions involving abnormal stimulation of epithelial cells (e.g. CC atheroscierosis), for birth control (inhibiting ovulation and placental corrections).

Soluble biologically active TREPA are used to treat TREPA-associated diseases, tumours or metastases. TREPA is used for inducing angiogenesis in human for promoting wound healing and for vascularising grafted tissue for successful grafting and to promote tissue grafts. The present amino acid sequence is clone ID #690050 human TREPA.

                                                                                                                                                                                                                                                                                                                                                CC expression vector pDC409-LZ-TWEAK. The fusion protein comprises a CC expression vector pDC409-LZ-TWEAK. The fusion protein comprises a CC growth hormone leader, a leucine apper multimerisation domain, and CC growth hormone leader, a leucine apper multimerisation domain, and CC used in the isolation of human TWEAK. The fusion protein was CC used in the isolation of human cDNA library. The TWEAK protein is CC eliments from a COS cell human cDNA library. The TWEAK protein is CC angiogenesis. TWEAKR may therefore be used to screen for and develop TWEAKR agonists and antagonists for the modulation of CC develop TWEAKR agonists and antagonists for the modulation of CC angiogenesis, to be used in the treatment and diagnosis of human disease. The disorders mediated by angiogenesis include ocular disorders CC characterised by ocular neovascularisation such as diabetic retinopathy, CC retrolental fibroplasia, rubeosis, uveitis, macular degeneration and CC corneal graft neovascularisation, and inflammatory diseases such as arthritts, rheumatism and psoriasis. Other treatable diseases include consist the human and prencephastic conditions, myocardial angiogenesis, CC haemophilic joints, scleroderma, vascular adhesions, atherosclerotic configure neovascularisation, telangiectasia, wound granulation, coronary atherosclerosis, peripheral atherosclerosis and ischaemia.

                                                CC receptor polypeptides: APO4, APO6, APO8 and APO9 or their active fragments, and isolated Tum related ligands 1 and 3 (TNRL1 and TNRL3) or their active fragments. APO4 is useful for diagnosing prostate cancer CC by determining levels of APO4 is useful for diagnosing prostate cancer CC by their active fragments. APO4 is useful for diagnosing prostate cancer CC be treated using APO4 selective binding agents linked to a therapeutic CC molety. APO4 polypeptides are also useful for identifying selective CC binding agents, useful in diagnosis/treatment of disease by binding of agents to the polypeptide/active fragment which is extracellular, or CC expressed on the cell surface. The binding is preferably performed in CC vivo. APO4 polypeptides/active fragments are also useful for screening CC for agonists and antagonists by binding and observing the changer in APO4 activity. Effective pharmacological agents useful in diagnosis or CC treatment of disease are also identified using APO4 polypeptides/active CC treatment of disease are also identified using APO4 polypeptides/active control of the cytoplasmic domain of APO4 and detecting a change in level of APO4 activity. The method is performed in vitro. APO polypeptides are all useful as immunogens for preparing antibodies. APO4 is also cuseful for diagnosis/treatment of developmental or gestational coll line controls.
                                  abnormalities.

suppress the immune system. It is useful to screen for TRELL receptors, by labelling with a detectable label and screening compositions for binding. Agents interfering with TRELL-receptor binding can also be screened for, can then be administered, optionally with interferon- gamma, to induce cell death or treat, suppress or alter immune responses (especially involving human adenocarcinoma cells) involving a signal pathway between TRELL and its receptor. It's coding sequence can be used in gene therapy for TRELL-related disorders in mammals (especially humans), e.g. tumours, autoimmune and inflammatory diseases or inherited genetic disorders, by introducing into cells, and expressing, therapeutically effective

This invention describes isolated Tumor Necrosis Factor (TNF) family receptor polypeptides: APO4, APO6, APO8 and APO9 or their active fragments, and isolated TNF related ligands 1 and 3 (TNRL1 and TNRL3) or their active fragments. APO4 is useful for diagnosing prostate cancer by determining levels of APO4 in an individual. Prostate cancer can also be treated using APO4 selective binding agents linked to a therapeutic molety. APO4 polypeptides are also useful for identifying selective binding agents, useful in diagnosis/treatment of disease by binding of

TREPA peptides can also be used to target cytotoxic agents or for affinity isolation of the corresponding receptor, the nucleic acid for which can be used to transform tumour cells to render them more responsive to TREPA and to screen for TREPA mimics.
